

# Assessing the CO<sub>2</sub> Reduction Impact of E-Bikes

Mike McQueen

Portland State  
UNIVERSITY

# About me

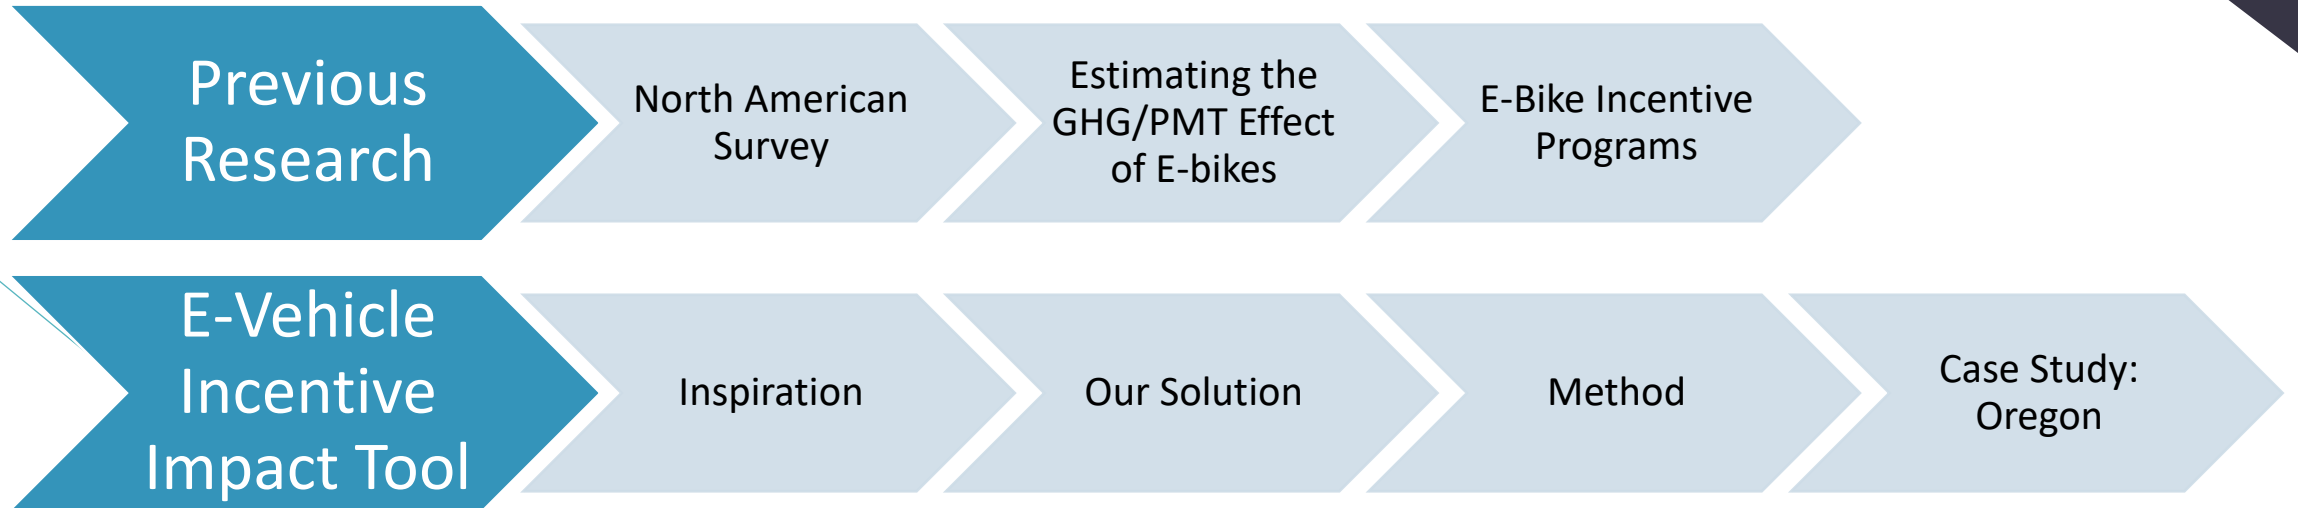

Michael McQueen

- Civil and Environmental Engineering Masters Student, PSU exp. 2020
  - Advisor: Kelly Clifton, PhD
- B.S. Mechanical and Aerospace Engineering, CWRU 2016
- Studying E-Bikes since 2018 with John MacArthur at TREC
- Research Interests: Transportation data, travel behavior, micromobility

# Agenda

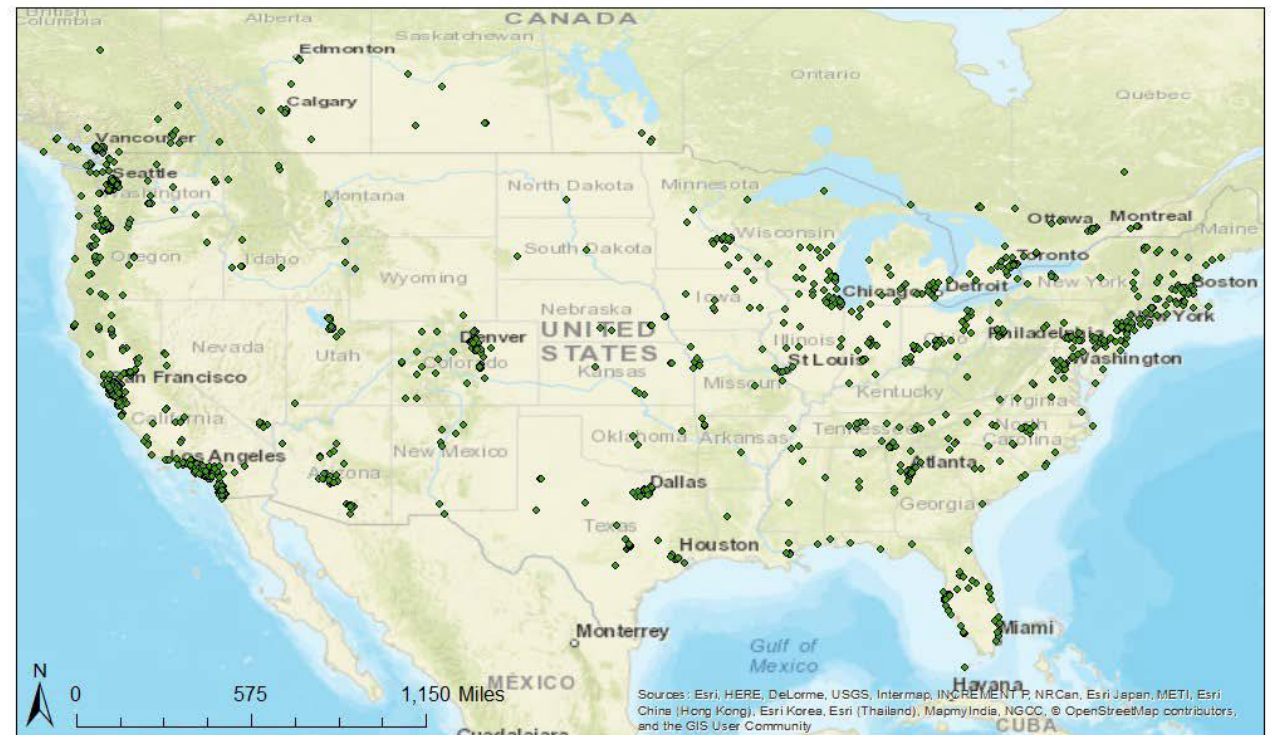

## Previous Research

# A North American Survey of Electric Bicycle Owners (2018)

- Increase cycling frequency
- Increase cycle trip distance
- Reduce impact of barriers
  - Hills
  - Bringing along cargo/children
  - Physical limitations (joint, respiratory, weight, dexterity)
  - Sweat
- Primary use cases (% of recorded trips):
  - Recreation or exercise (35.6%)
  - Commute (32.7%)
  - Personal errands (19.9%)
- Enhance perceived safety and joy of riding

Previous  
Research

North American  
Survey

Estimating the  
GHG/PMT Effect  
of E-bikes

E-Bike Incentive  
Programs

# Estimating the Effect of E-Bikes on Person Miles Travelled and Greenhouse Gas Emissions (2019)

- 15% PMT mode share leads to 12% reduction in CO<sub>2</sub> emissions
  - 8,079 metric tons to 7,088 metric tons CO<sub>2</sub> per day
  - Portland Metro excluding Clark County
- 1 e-bike saves 225 kg CO<sub>2</sub> per year
- Unchanging when considering “induced trips”
- Car trip mode share would be reduced from 84.7% to 74.8%
- Car PMT would be reduced from 28.9M to 25.5M per day

# How E-Bike Incentive Programs are Used to Expand the Market

- Existing incentive programs:
  - Partial purchase subsidies
    - Austin, TX
    - Burlington, VT
  - Vendor-funded discounts
    - Boulder County, CO
  - Employer Sponsored
    - UK
  - Government Sponsored Loan
    - Scotland
- Experience-based education works
- Consider program partners strategically
- Use preferred vendors
- Get creative with income streams

Programs

## E-Vehicle Incentive Impact Tool

# Inspiration

- “The Case for a UK Incentive for E-Bikes” Newson and Sloman (2019)
- Provided a metric for “cost per kg saved” ( $\$/\text{kg CO}_2$ )

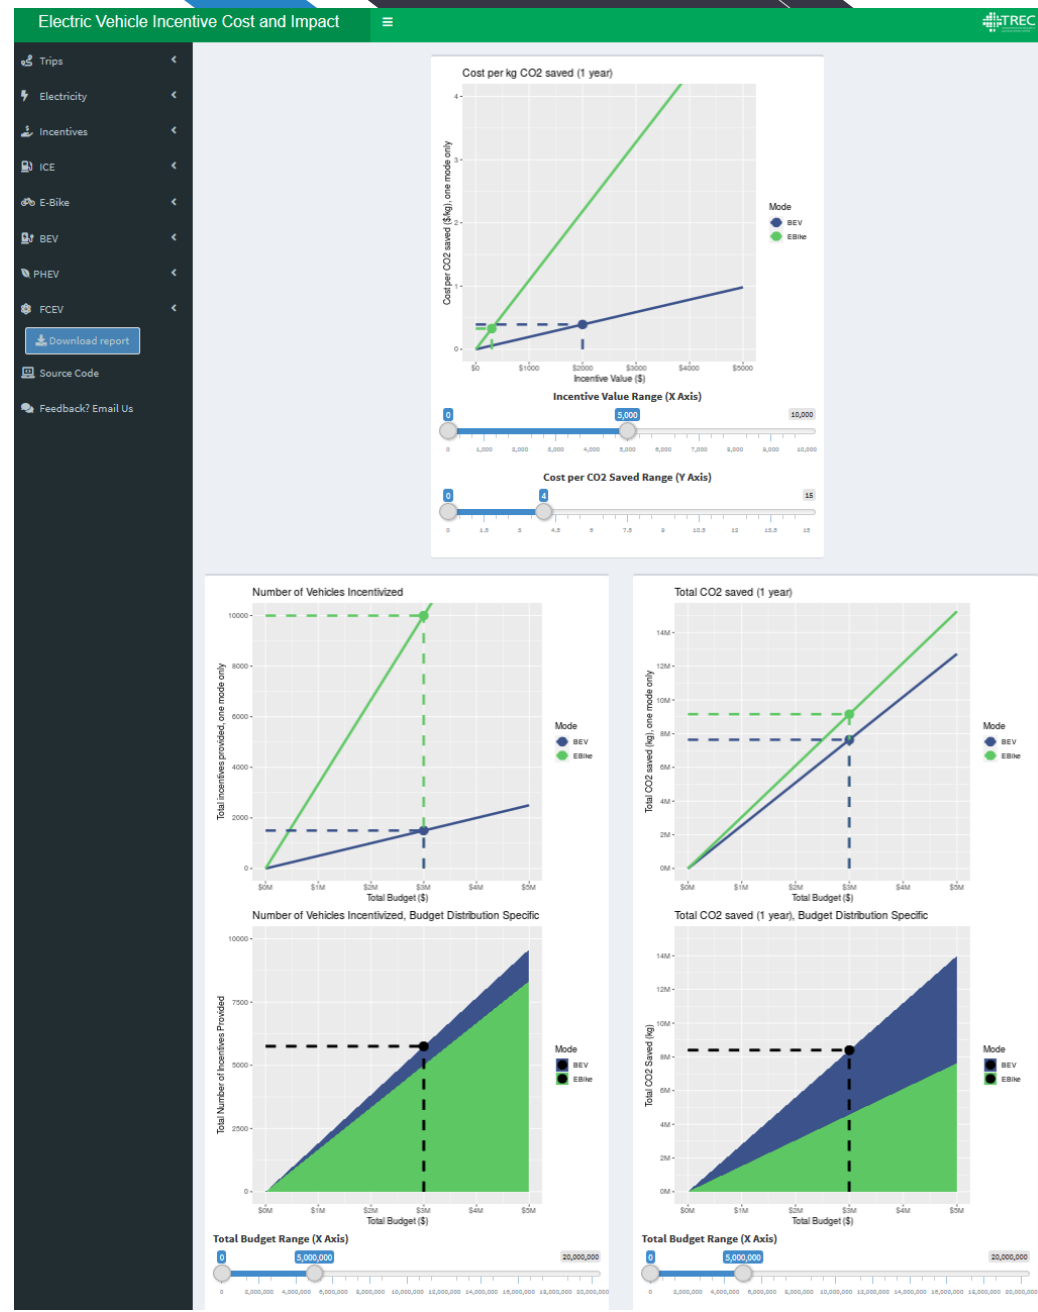

*“An e-bike grant scheme would be more than twice as effective, per pound spent, as the current grants offered to buyers of some electric cars”*

- Could we calculate this for Oregon?

# Our Solution

- Online tool that anyone can use to estimate several things:
  - Cost efficiency (\$/kg CO<sub>2</sub>)
  - Total vehicles incentivized
  - Total CO<sub>2</sub> saved
- Exports a report that can be saved

# Method

1. Calculate average ICE (gasoline) vehicle CO<sub>2</sub> emissions per year
2. Calculate average CO<sub>2</sub> emissions from electricity generation for e-bike, BEV, PHEV, and/or FCEV based on local electricity profile
3. **CO<sub>2</sub> saved = CO<sub>2,ICE</sub> - CO<sub>2,EV</sub>**

(For E-Bike, we assume that the e-bike only replaces a portion of ICE miles. Default is 15%)

Incentives

## Incentive Program Budgeting

E-Bike incentive (\$)

350

BEV incentive (\$)

2500

PHEV incentive (\$)

2500

Total budget (\$)

12000000

E-Bike Budget Percentage Allotment

0 33 100

0 10 20 30 40 50 60 70 80 90 100

BEV Budget Percentage Allotment

0 33 100

0 10 20 30 40 50 60 70 80 90 100

PHEV Budget Percentage Allotment

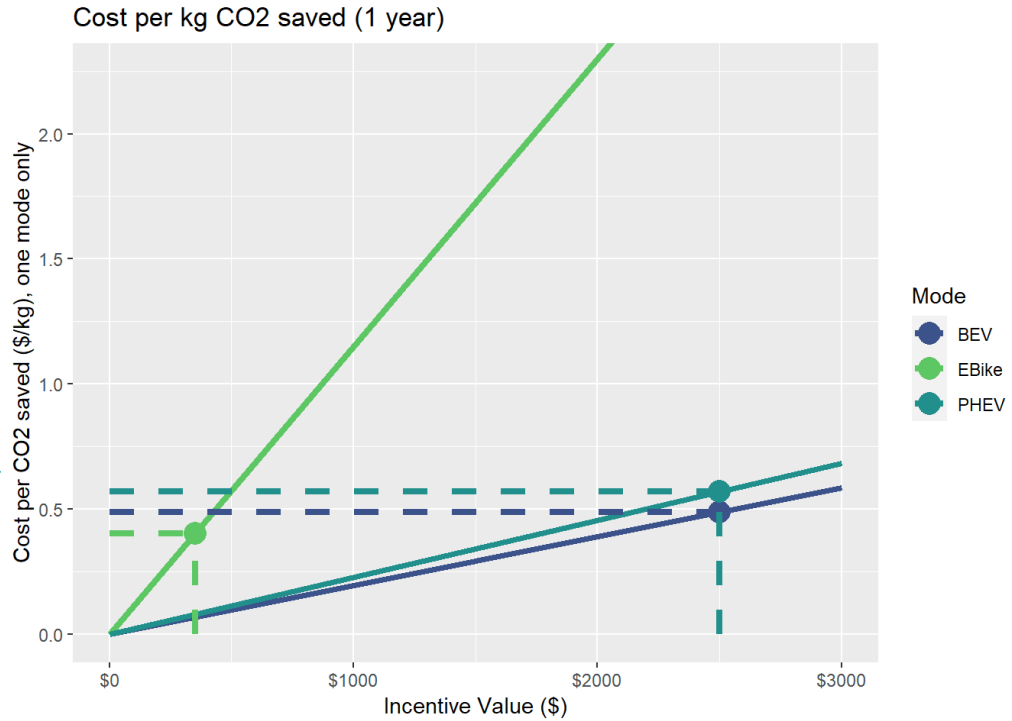

0 33 100

0 10 20 30 40 50 60 70 80 90 100

# Case Study: Oregon

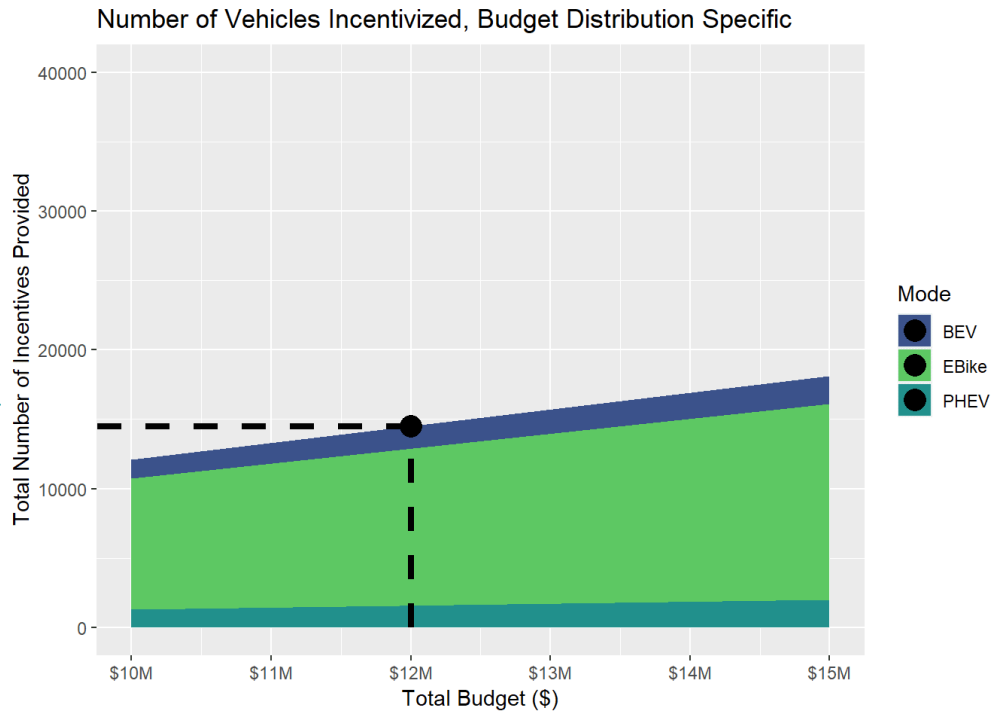

Mode	Incentive Amount	CO2 saved per vehicle, per year	Cost per kg CO2 Saved
E-Bike	\$ 350.00	869.36 kg	\$ 0.40
BEV	\$ 2500.00	5118.08 kg	\$ 0.49
PHEV	\$ 2500.00	4381.14 kg	\$ 0.57

# Case Study: Oregon

Total Budget (\$)

Mode	Allotted Percent of Total Budget	Allotted Portion of Total Budget	Number of Incentives
E-Bike	33%	\$ 4M	11314
BEV	33%	\$ 4M	1584
PHEV	33%	\$ 4M	1584

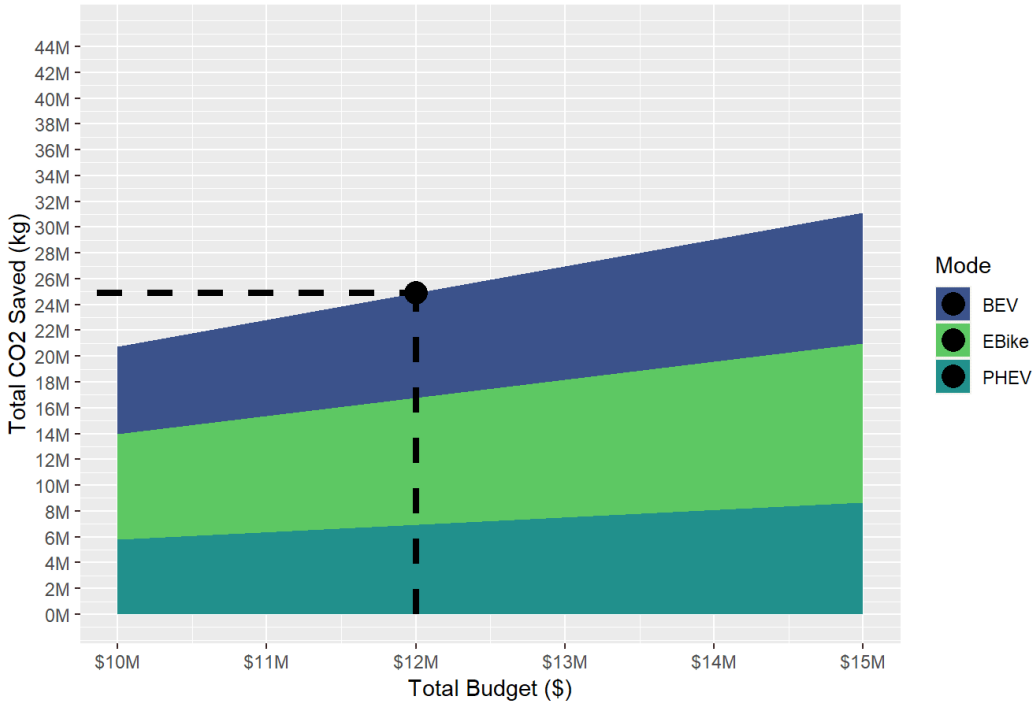

# Case Study: Oregon

Total CO2 saved (1 year), Budget Distribution Specific

Mode	Allotted Percent of Total Budget	Allotted Portion of Total Budget	Total CO2 Saved by this mode
E-Bike	33%	\$ 4M	10.2M kg
BEV	33%	\$ 4M	8.5M kg
PHEV	33%	\$ 4M	6.8M kg

# Thank You.
